

How to Use GIT

Step 1. Create your account in GIT

Step 2. Create Repository on web browser example

GitHub, Inc. (US) | <https://github.com/new> Search

Search GitHub Explore Gist Blog Help Akhilesh-sahu2

Owner Akhilesh-sahu2 / **Repository name** dataStructureAndAlgorithm ✓

Great repository names are short and memorable. Need inspiration? How about **potential-computing-machine**.

Description (optional)
This is a project which shows example of DataStructure and Algorithms

☒ **Public**
Anyone can see this repository. You choose who can commit.

☐ **Private**
You choose who can see and commit to this repository.

☒ **Initialize this repository with a README**
This will let you immediately clone the repository to your computer. Skip this step if you're importing an existing repository.

Add .gitignore: **None** Add a license: **None** ⓘ

Create repository

HTTPS clone URL
<https://github.com/Akhilesh-sahu2/dataStructureAndAlgorithm>

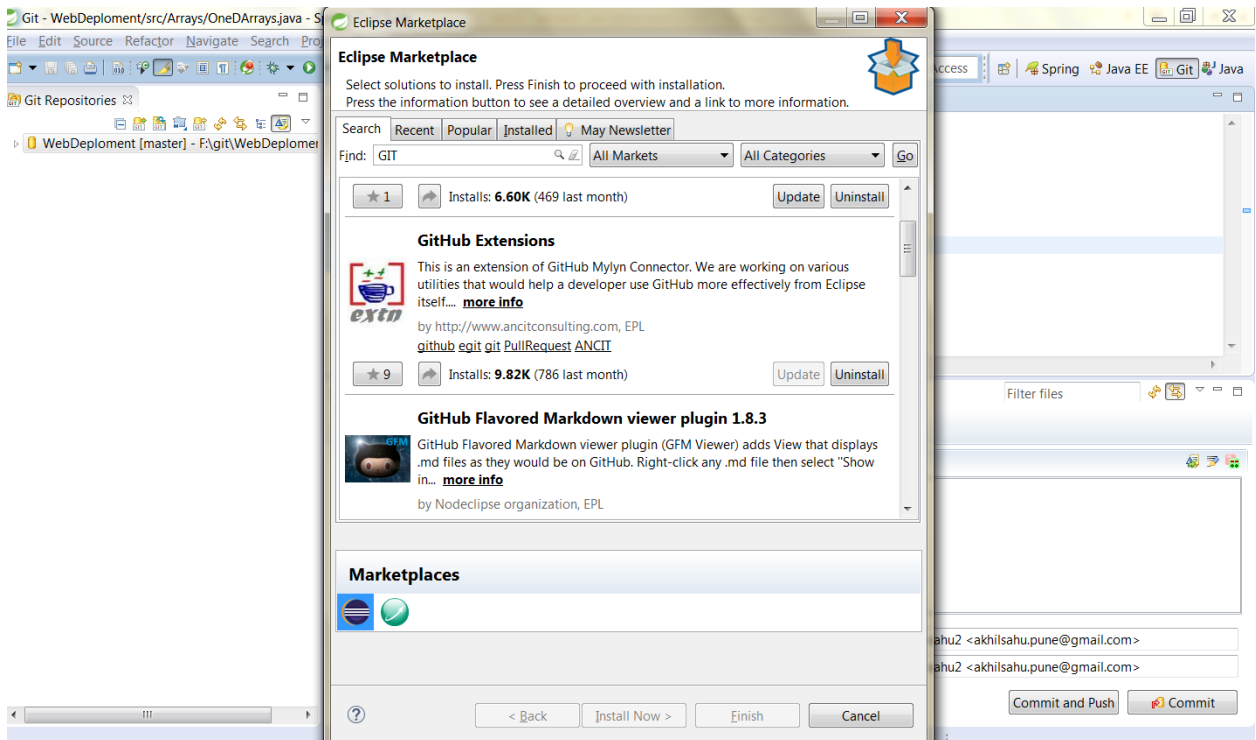

You can clone with **HTTPS, SSH, or FTP**

Now take the clone URL and clone it where u want to use example eclipse

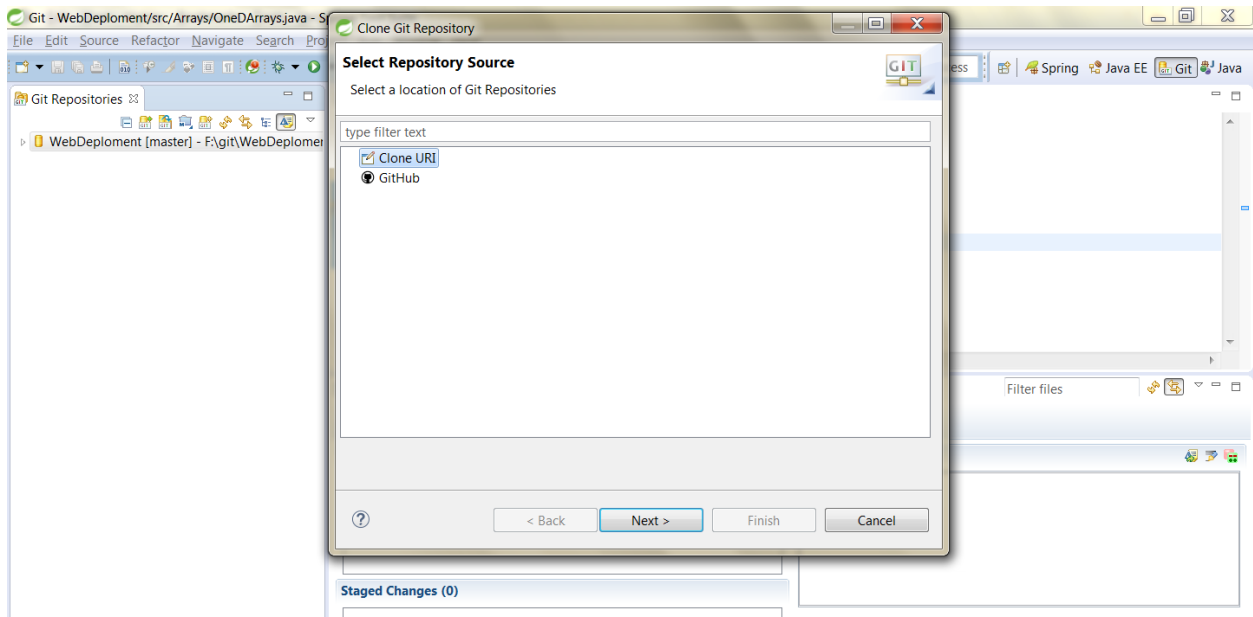

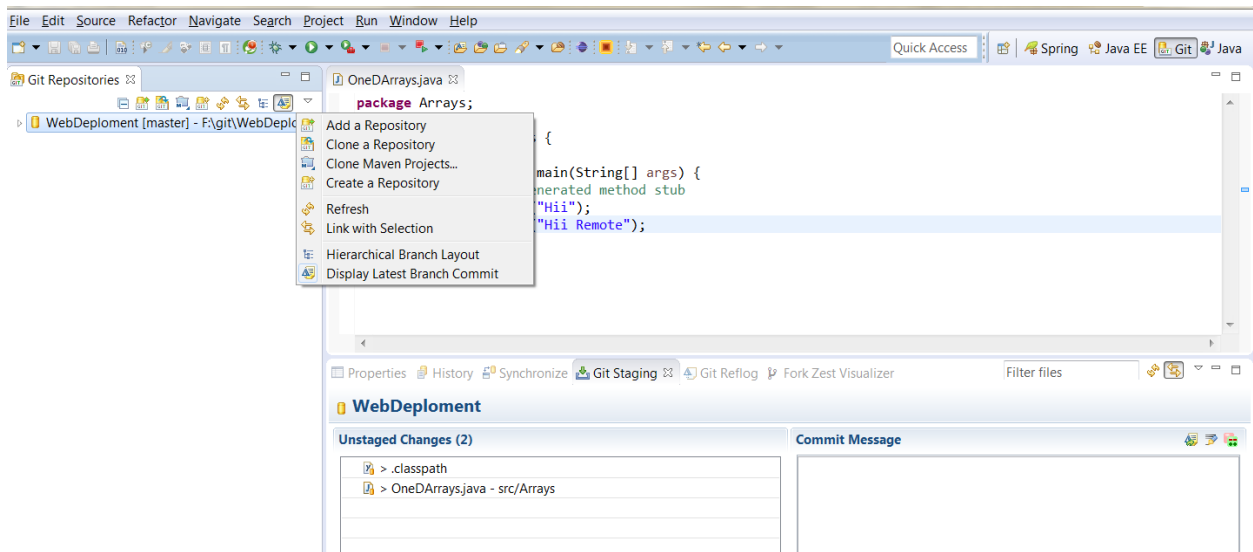

Eclipse setup

Go to marketplace and install GitHub extensions for eclipse

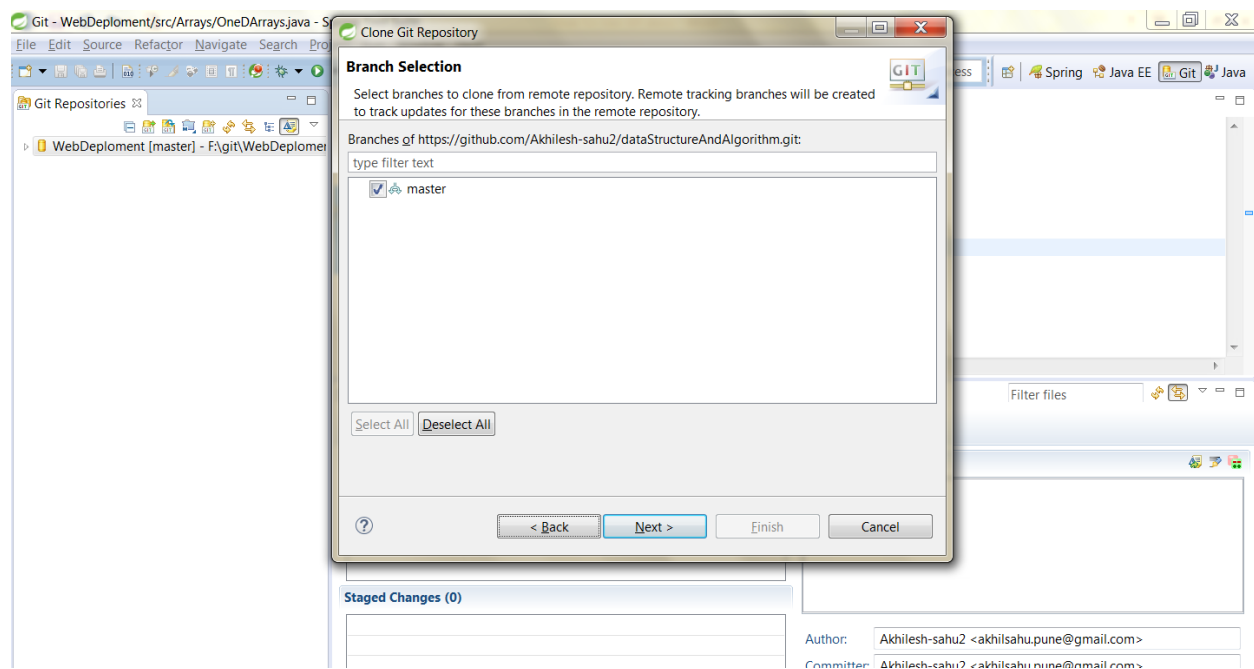

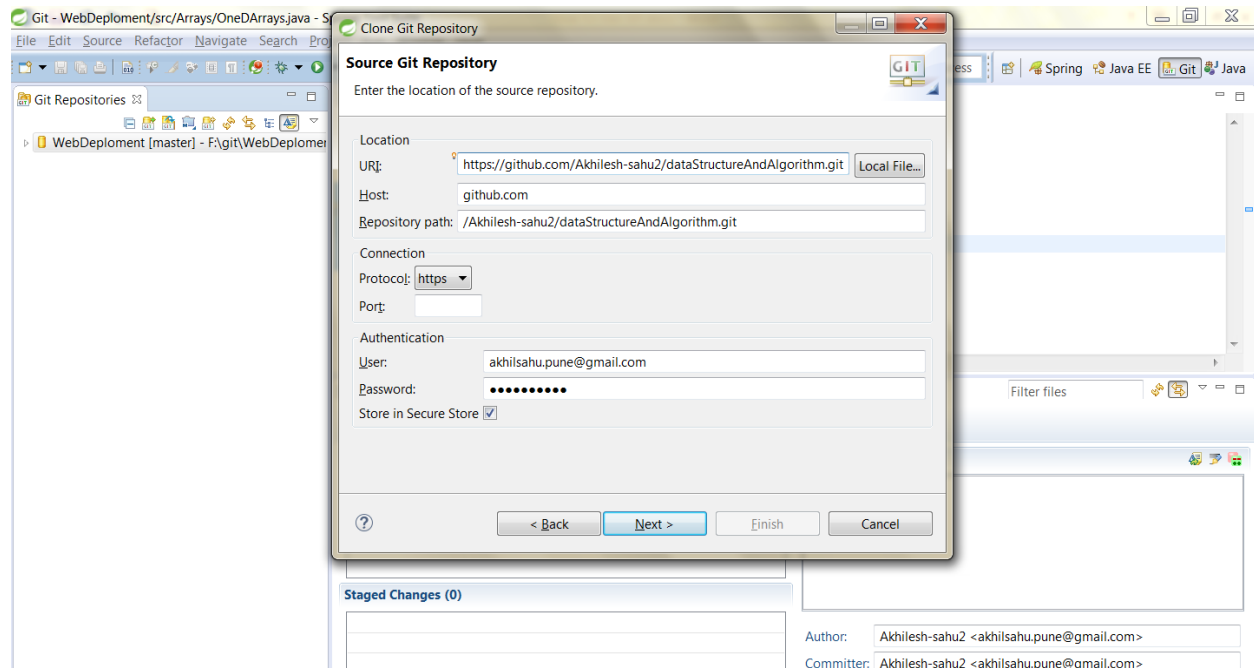

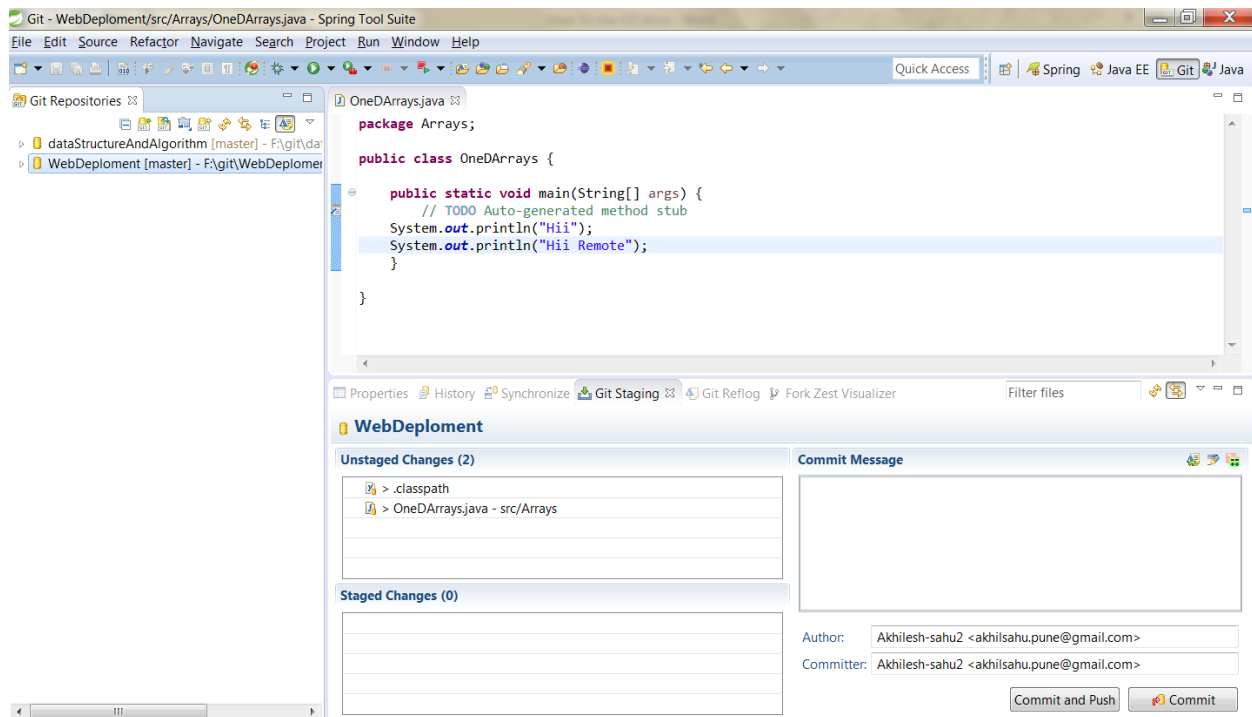

After installing it open git perspective

Clone Ur Repository Local through STS Eclipse

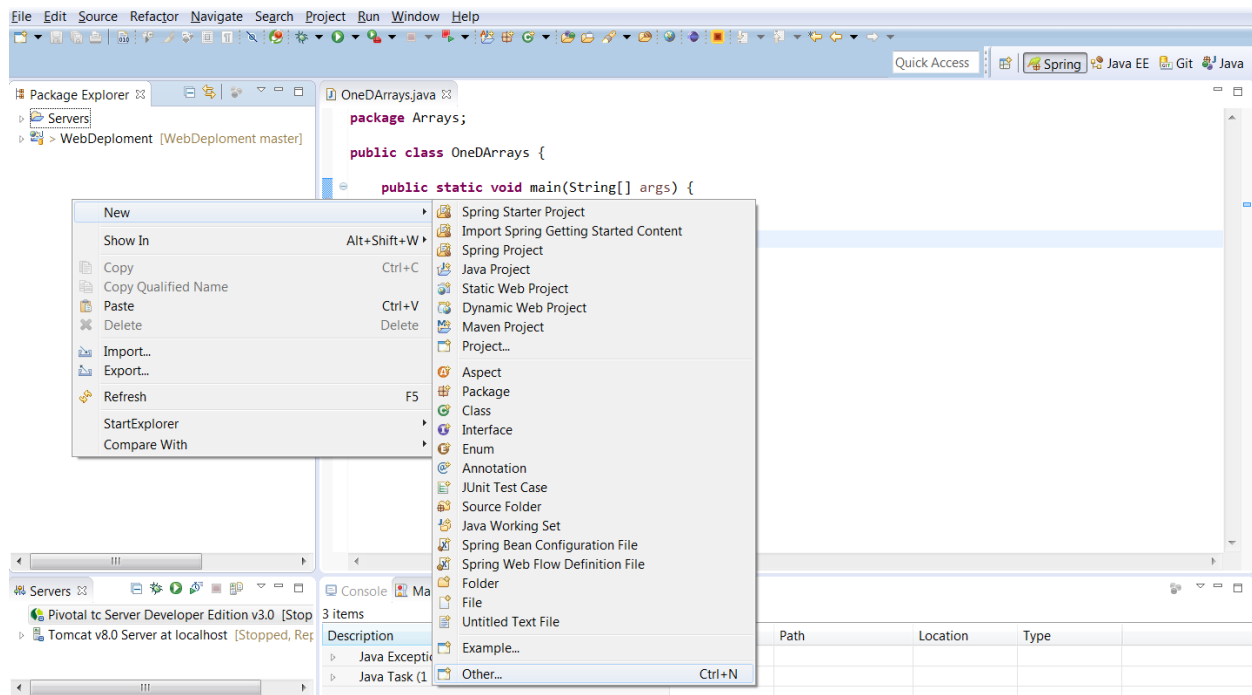

Enter ur git username/emailed and password

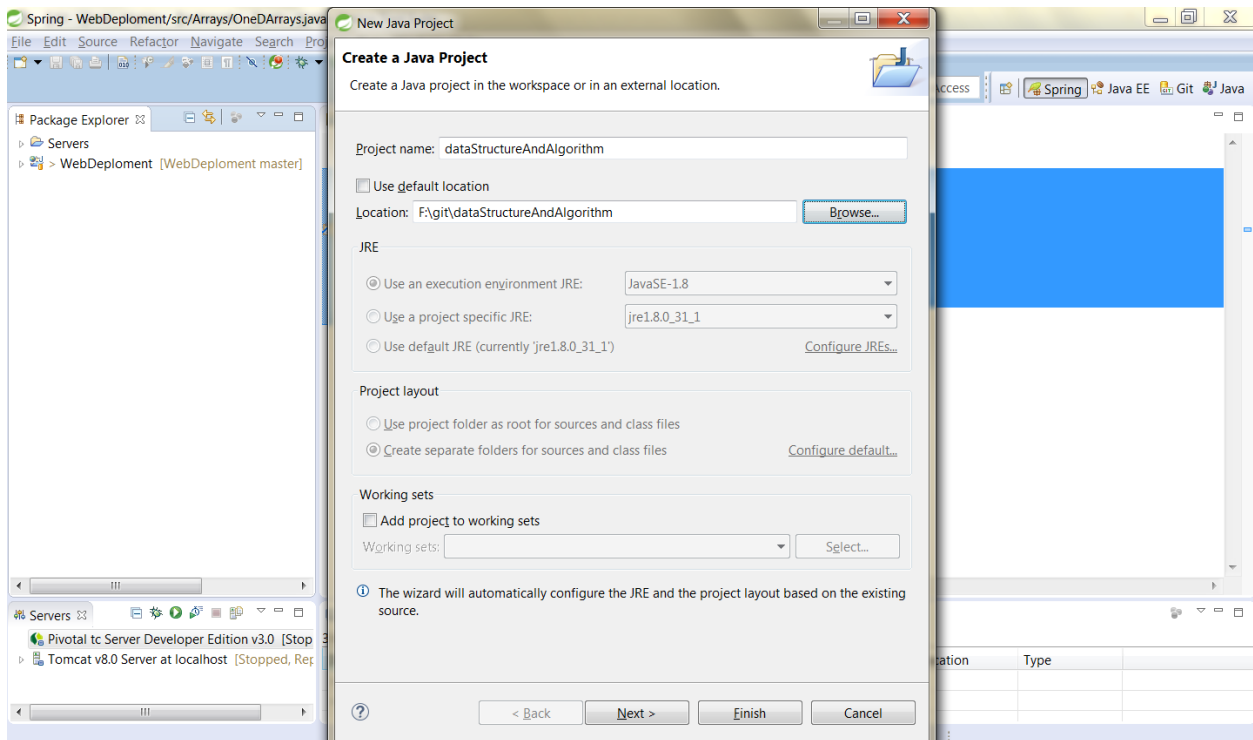

It will create a repository locally

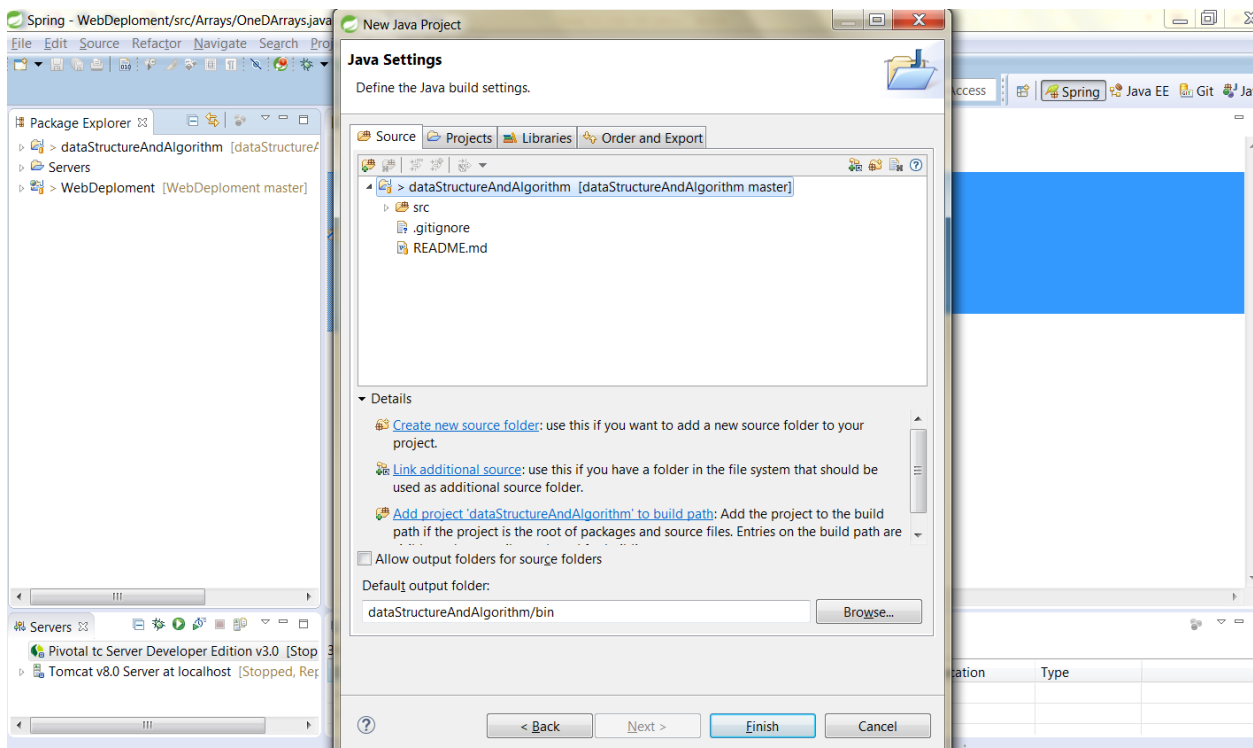

For creating your project in repository go in project explorer and create what kind of project you want to create

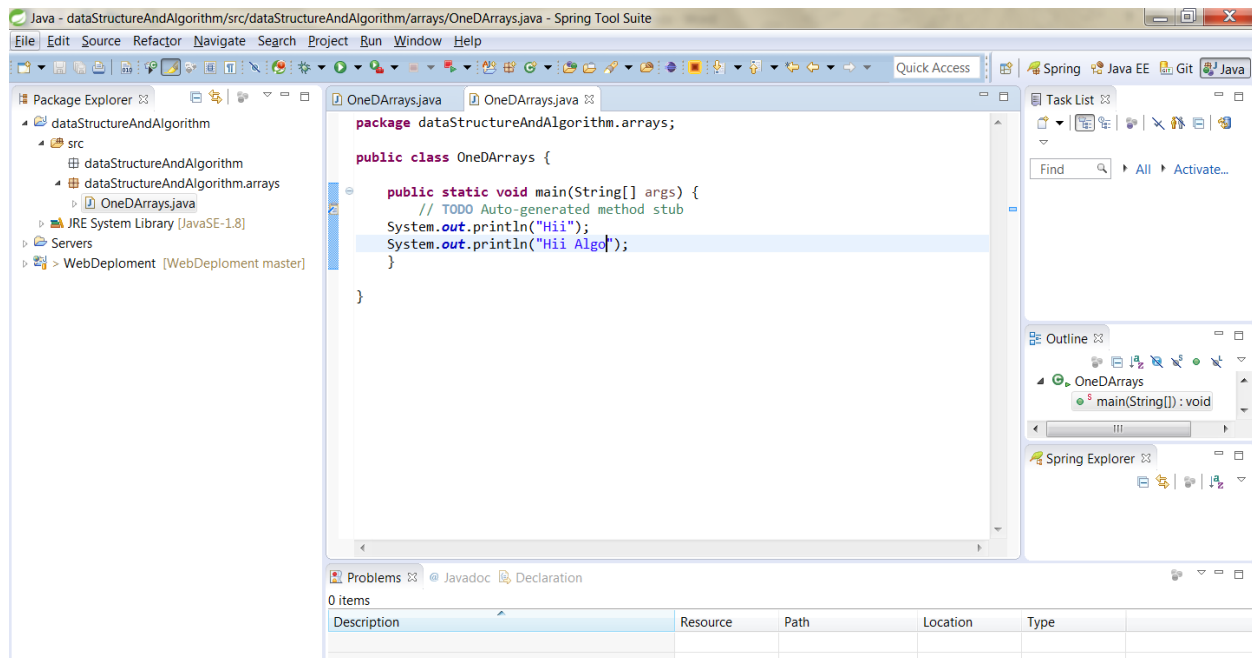

For creating project use the same path where you have cloned the repository

Create project with the same name as repository

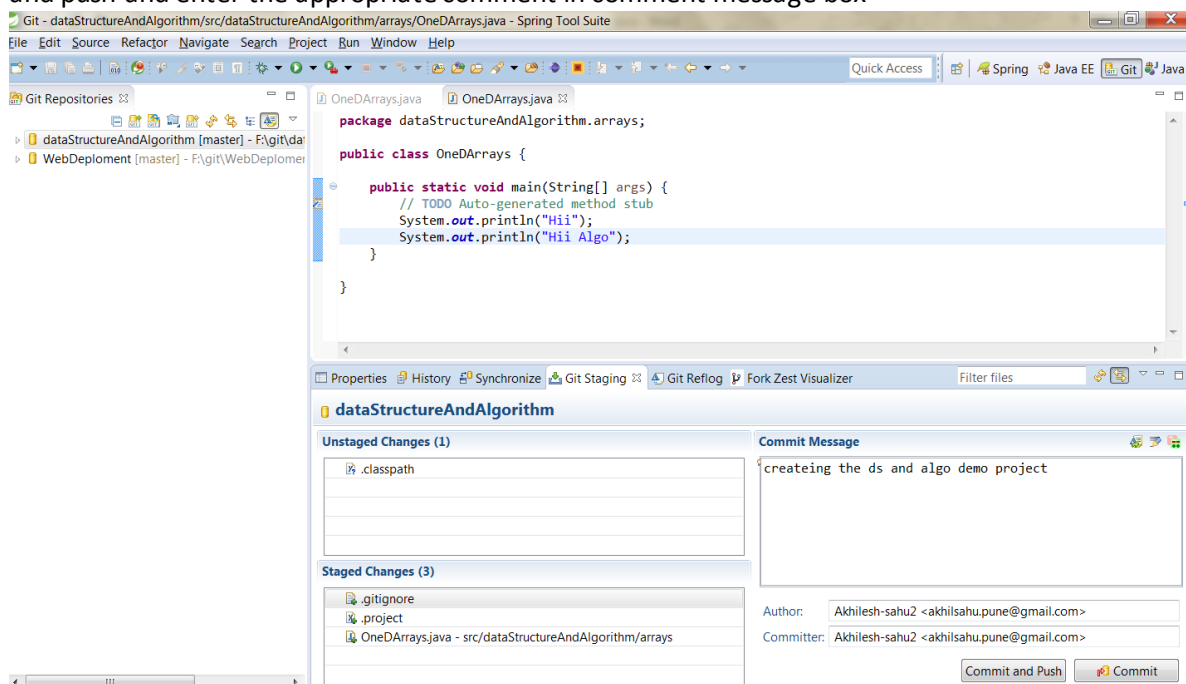

Now create your file in the project as you like

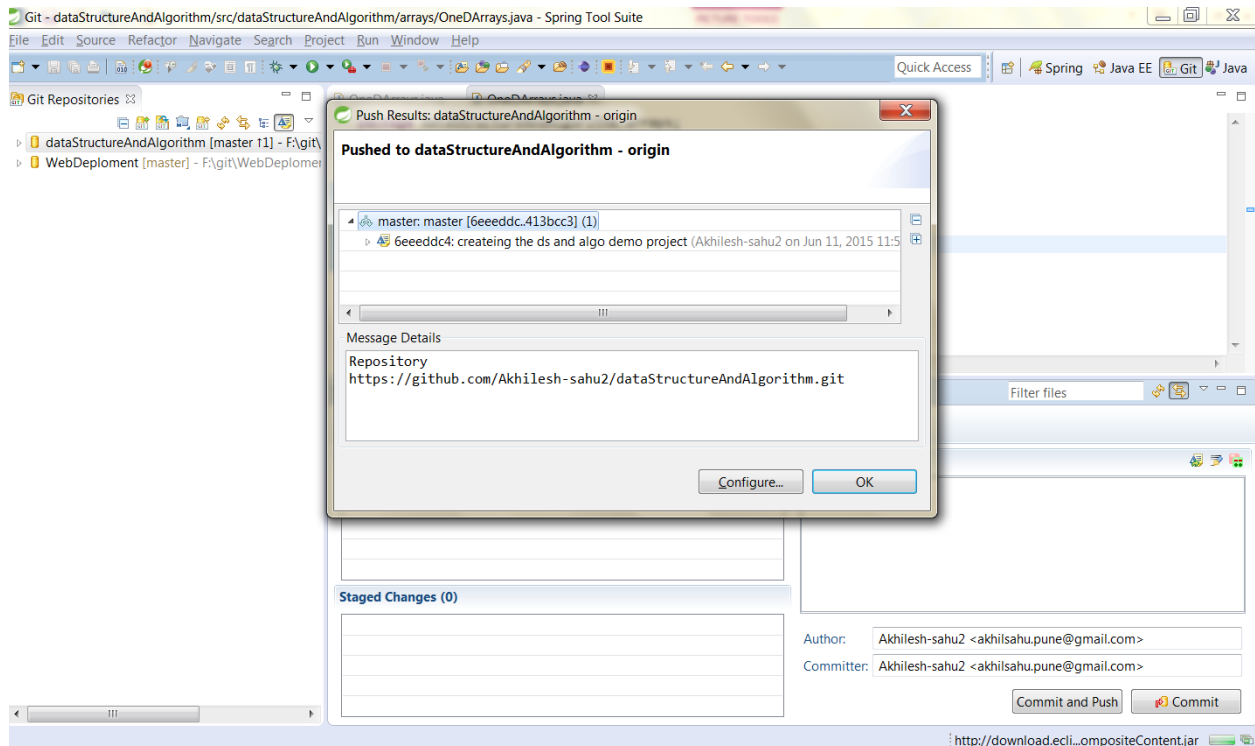

Now For committing and pushing the changes that you have made go in gitstaging and select the repository it will shows changes in the unstaged changes window.

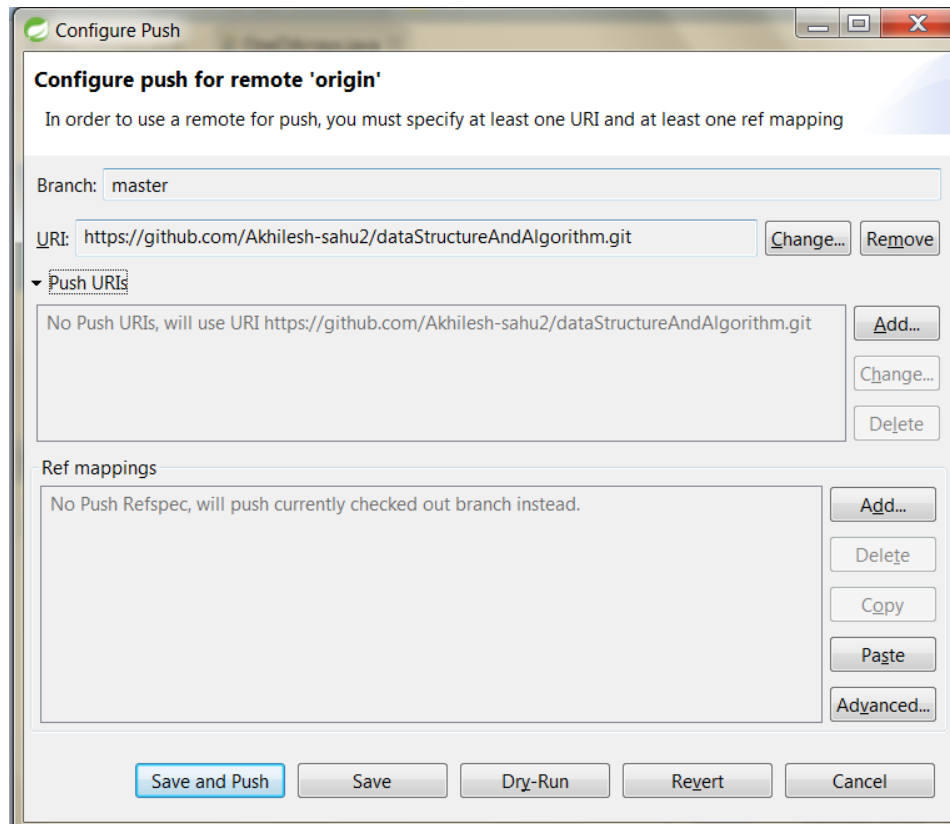

Select which changes u want to commit and push (drag and drop in staged changes) and click oncommit and push and enter the appropriate comment in comment message box

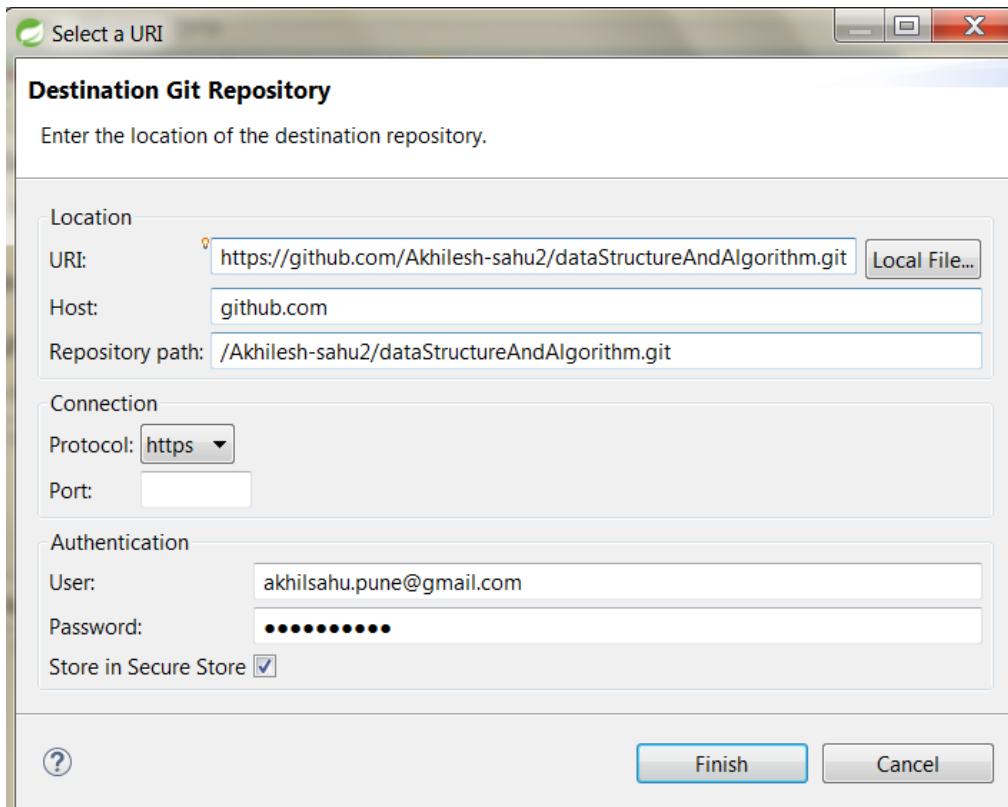

After clicking u will see the window like this

Now u have to configure the push path. Click on configure

Add push url as it is as in URL box

Select a URI

Enter the location of the destination repository.

Location

URI:

Host:

Repository path:

Connection

Protocol:

Port:

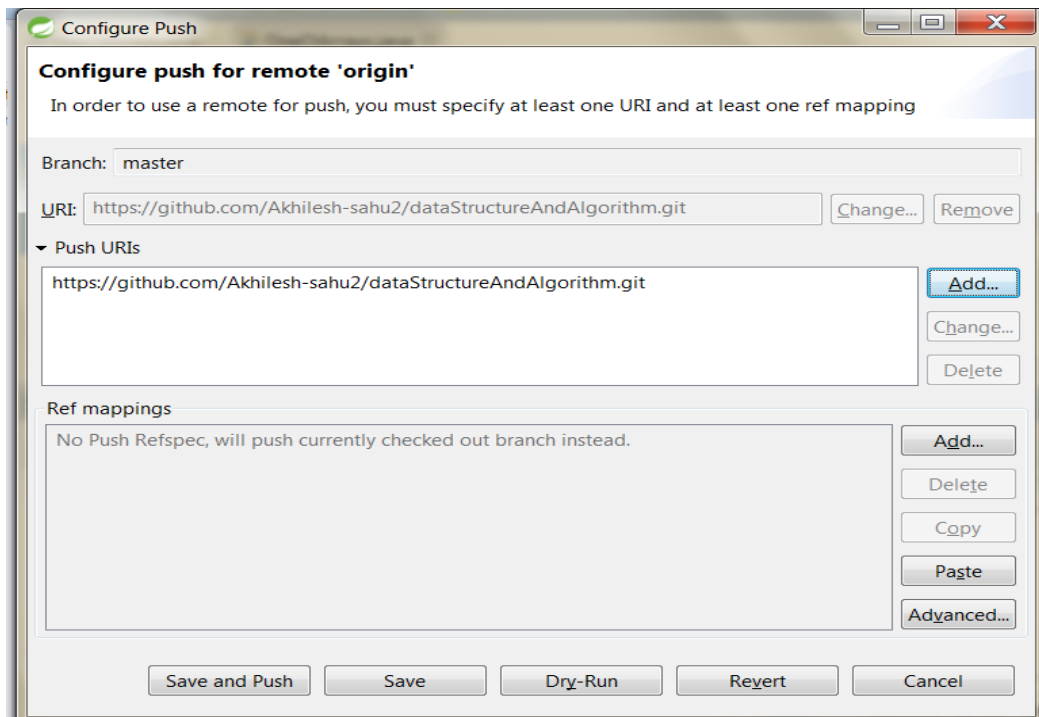

Authentication

User:

Password:

Store in Secure Store ☒

Click on finish

Configure Push

Configure push for remote 'origin'

In order to use a remote for push, you must specify at least one URI and at least one ref mapping

Branch:

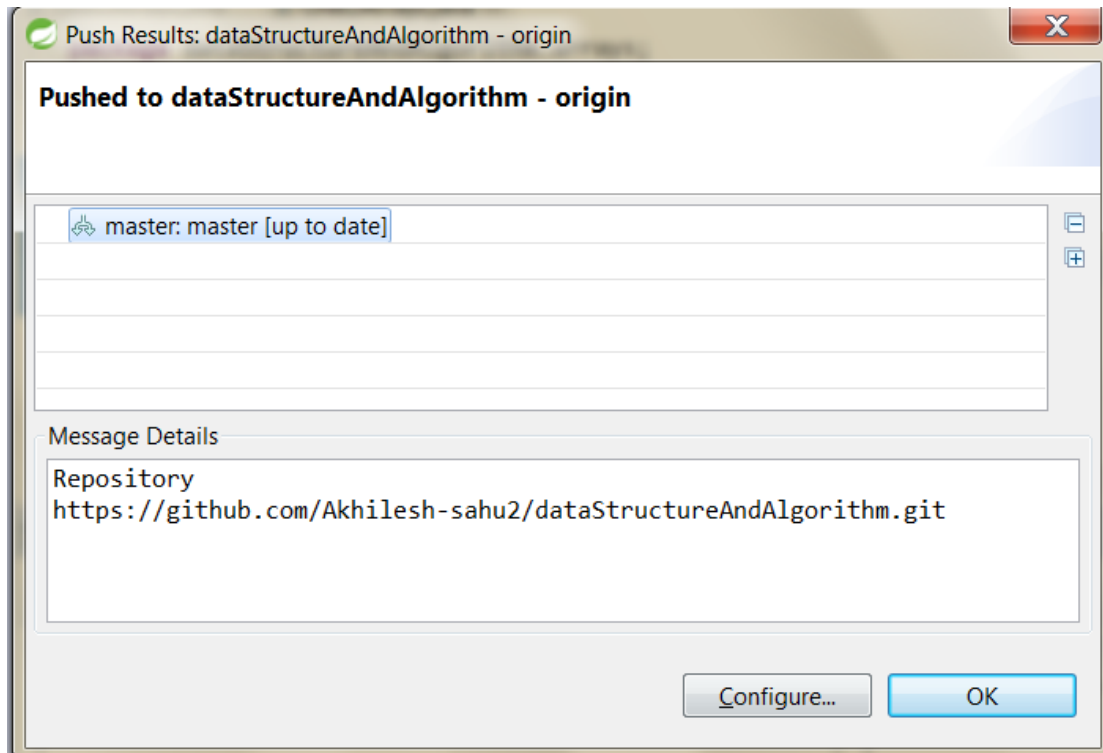

URI:

▼ Push URIs

Ref mappings

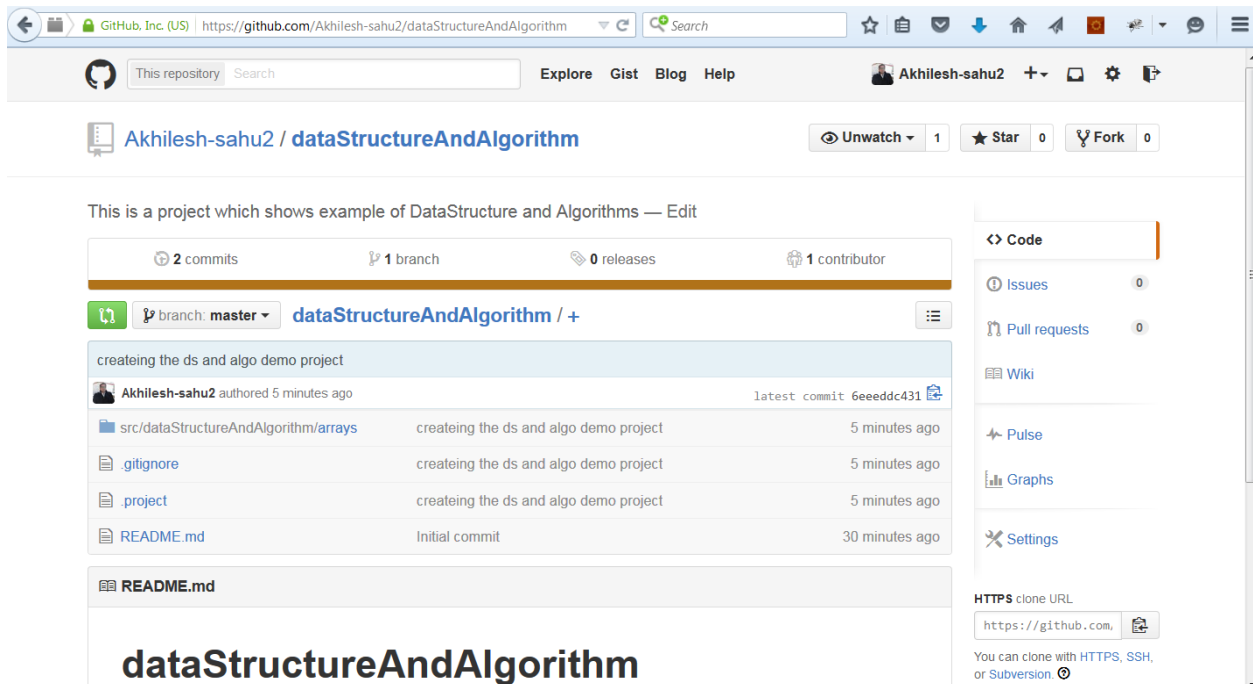

No Push Refspec, will push currently checked out branch instead.

Now save and push

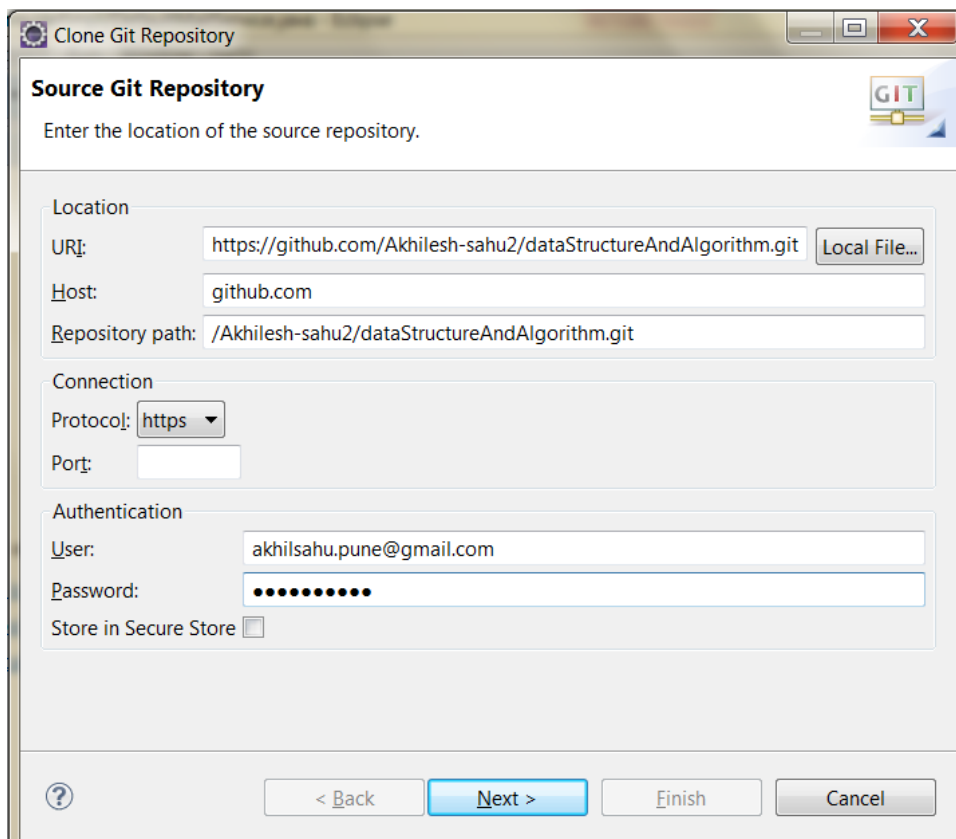

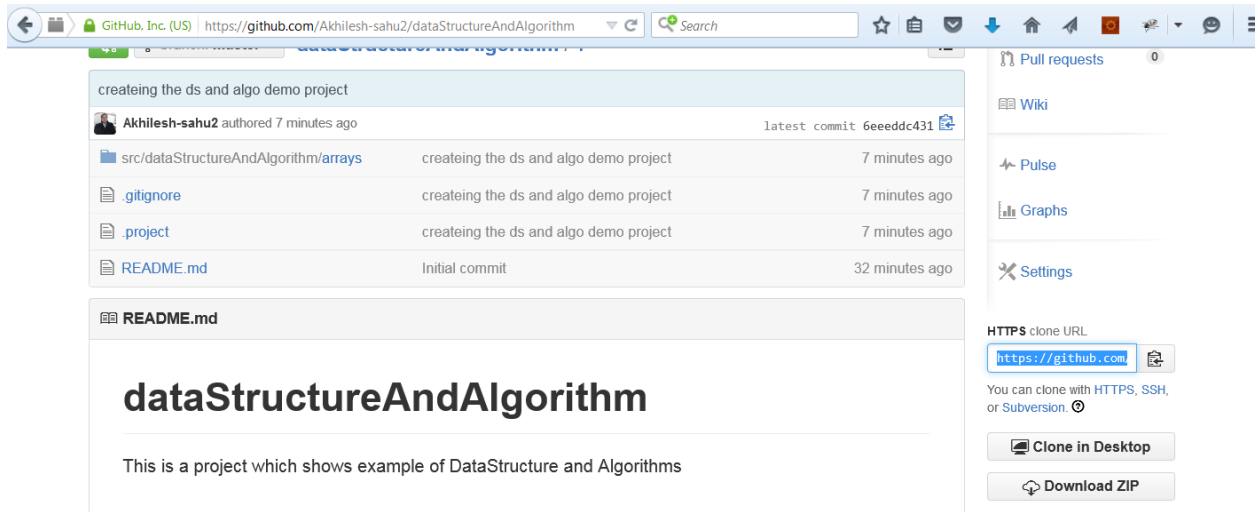

Click ok that it all

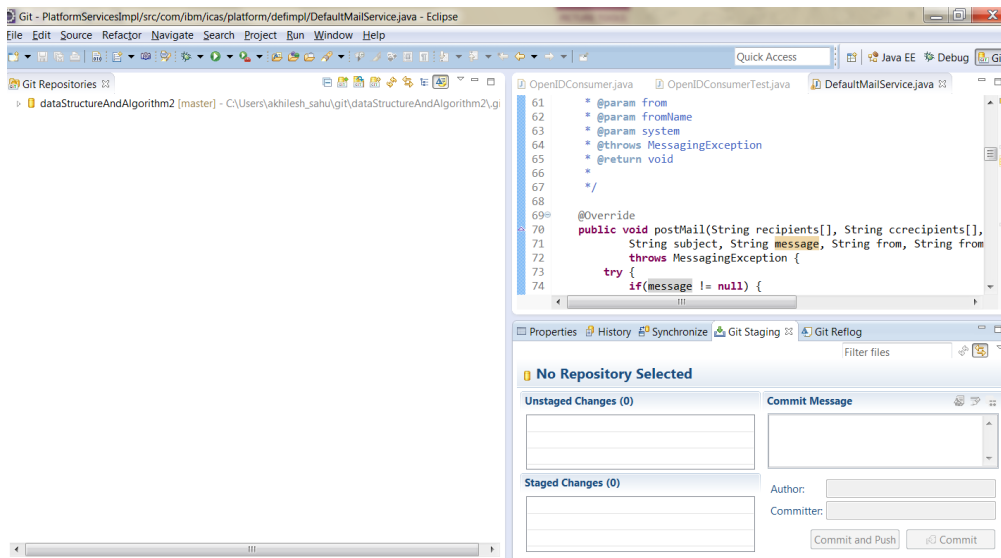

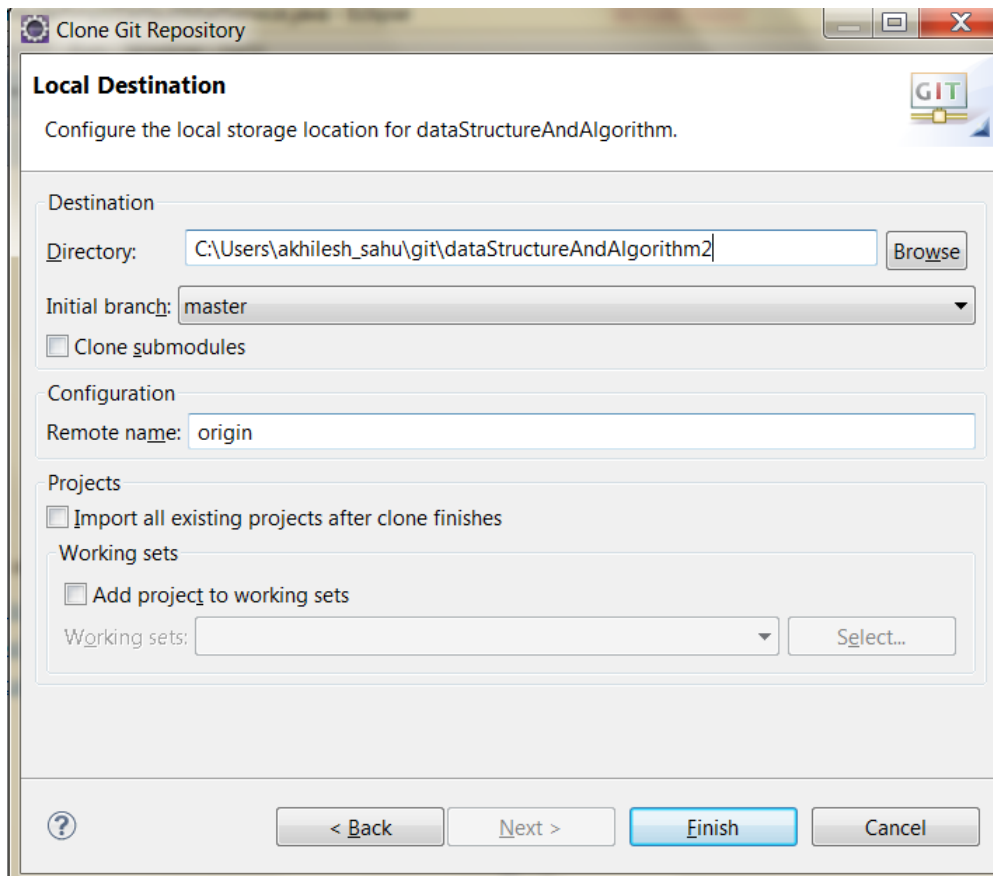

Check ur repository on git account on web

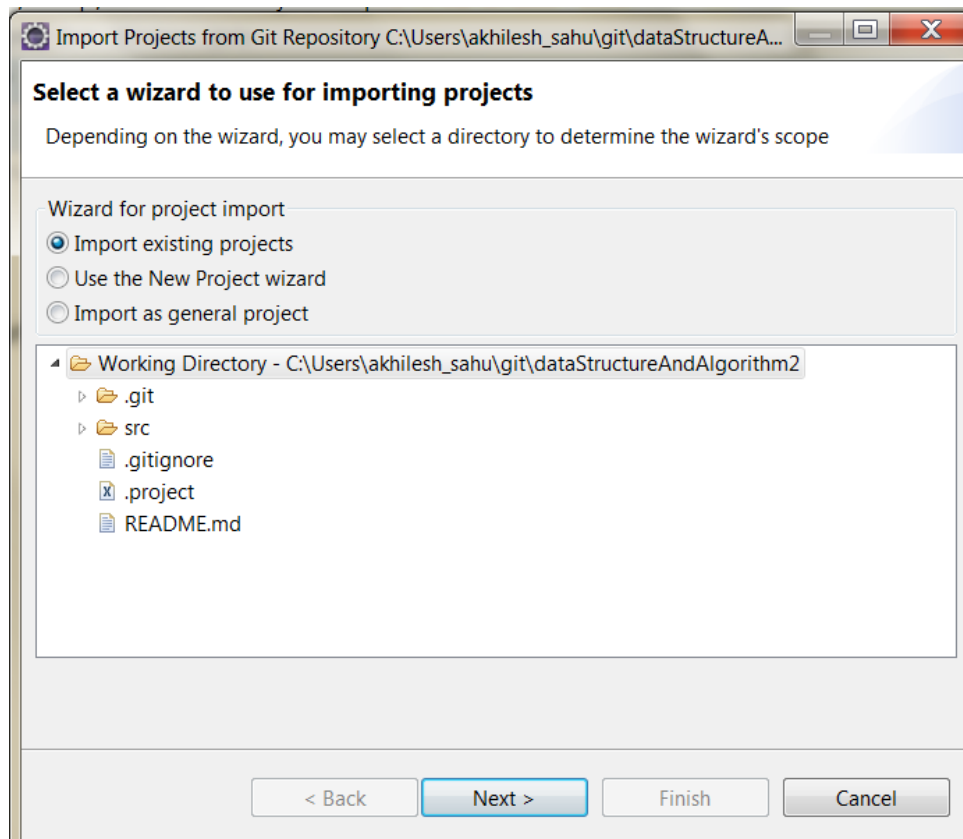

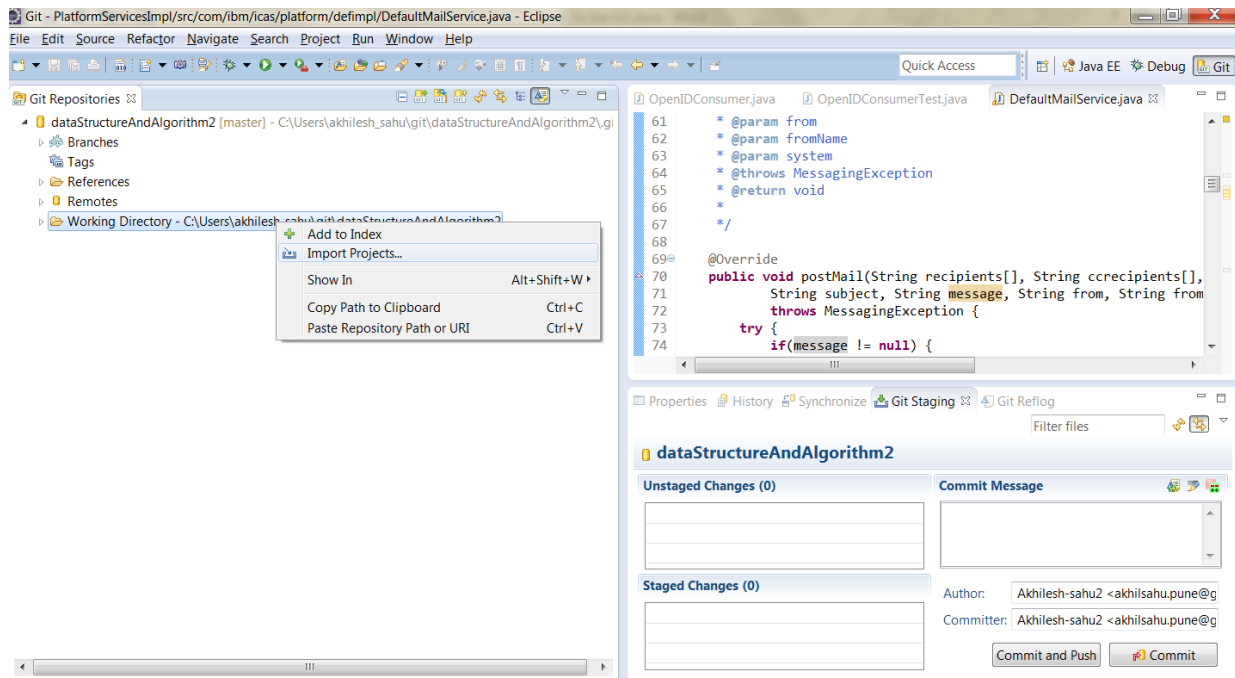

Now your Git repository is ready with your project

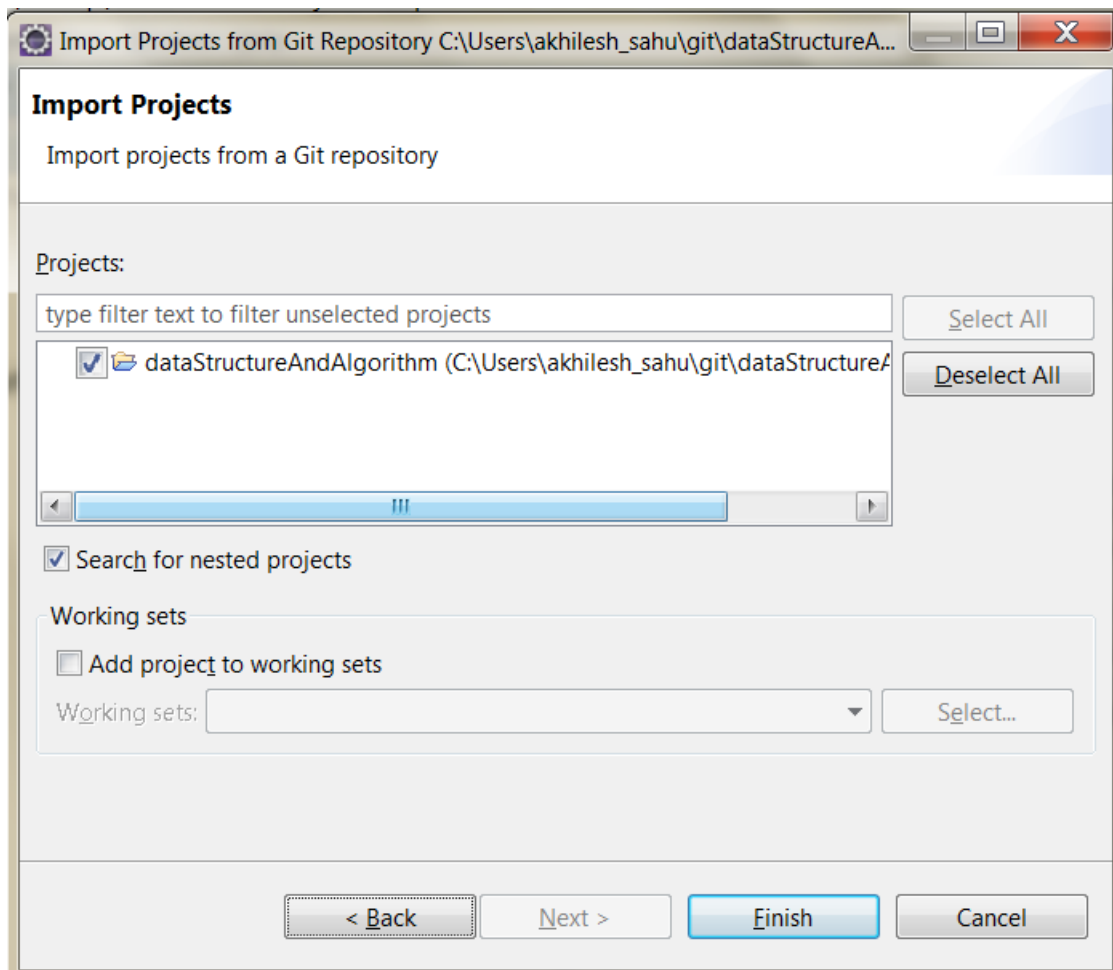

If you want to use this on any other place just make a clone repository with clone URL

Creating project in ur working set select Working directory → import project

Click finish and you are able to see project in your explorer (Project explorer)

All done for work from multiple pupal
